PURPOSE

To establish parameters for the usage of Tranexamic (TXA)

SPECIAL INSTRUCTIONS/FORMS TO BE USED

N/A

PROCEDURE

I. TXA should be administered to patients with signs of impending shock from hemorrhage.

II. Provide all initial medical care and control bleeding if able.

III. Initiate any needed trauma care along with fluid replacement.

IV. Do not delay transport.

V. TXA should be started within 45 minutes of injury and may be started on scene if a delay in transport exists. (ie entrapment, extrication, waiting for a transport vehicle, etc.) Otherwise start en route.

VI. Contact Medical Control(MC) and advise of pt condition along with ETA. Remind ED Physician that you carry and wish to start TXA.

VII. If MC agrees start the TXA as follows. Draw up 1 Gram of TXA( 1Gram/10ml) and mix into a 50 ml bag of 0.9% NS. Run a 1 drop/sec through a 10 drop secondary set. The bag should take approximately 10 minutes to infuse.

VIII. Vital Signs must be taken every 5 minutes.

IX. Record on the PCR.

X. TXA must be replaced in pharmacy or by the Charge Nurse.
